5G and millimeter-wave (mm-wave)

Introduction

- 5G ramp imposes complexity and economic challenges throughout the semiconductor ecosystem.
- Integration complexity in 5G-FR1 (Sub-6 GHz) and 5G-FR2 (mmWave).
 - More antennas, bands, filters
 - Higher frequency, data rates
 - Greater bandwidth
- Economics in keeping smartphones affordable and profitable without sacrificing quality.

Forecast 5G-Enabled Smartphone Unit Shipments (2019-2025)

High Volume Manufacturing of 5G RF Transceivers

³ 2022

5G and millimeter-wave (mm-wave)

Objective

- 5G smartphone leverages automated test equipment to find manufacturing defects in RF transceivers.
- Today the baseline is x8 site density.
- Explore economic benefits of doubling the site density to x16 on total cost of test (CoT) and total cost of ownership (TCO).

High Volume Manufacturing of 5G RF Transceivers

TestConX Workshop

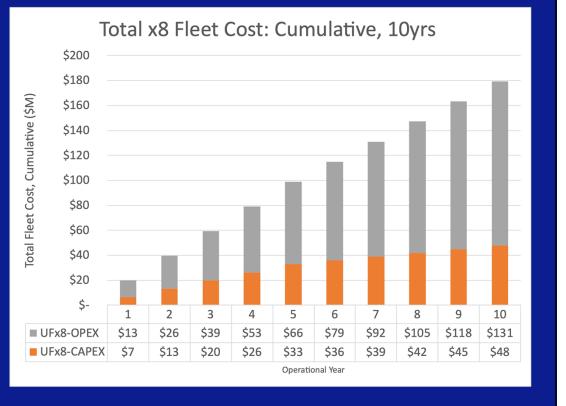

www.testconx.org

5G and millimeter-wave (mm-wave)

Methodology

- Baseline RF economics for x8 sites. Representative model enables study of lifetime cost of test versus CapEx & OpEx.
- RF plan for x16 sites.
 High-level, compare and quantify site density benefits by TCO.
- Fleet planning assumptions
 - 100M units per year @ 80% utilization
 - 30 secs test duration
 - 5 years depreciation, 10 years lifetime
 - 1B total unit shipments

High Volume Manufacturing of 5G RF Transceivers

2022

TestConX 2022

5G and millimeter-wave (mm-wave)

First-Order Approximation

- Factor of test cells in fleet
- OpEx: Operational cost/hr as function of floor space
 - And consumables
- CapEx, total test cell
 - ASP tester
 - ASP handler (< 2x expensive for x16)
 - DUT board, 1-yr depreciation
- Cost of Test per DUT: (CapEx_{depr} + OpEx) / units
- Total cost of ownership, TCO

High Volume Manufacturing of 5G RF Transceivers

T

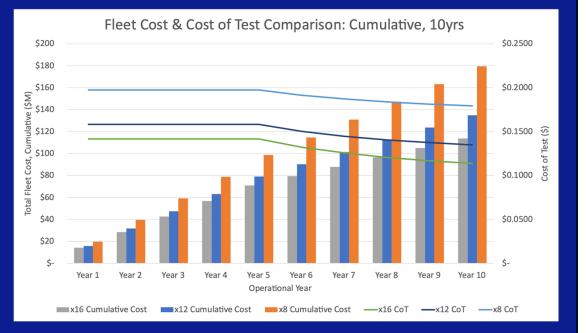

Total Lifetime Overview: x8, x12, x16 sites

Results & Discussion

- Cumulative CoT (& TCO) results
 - X8 → \$0.18 (\$180M)
 - X12 → \$0.13 (\$140M), 25%
 - X16 → \$0.11 (\$115M), 35%
- Year 1
 - CapEx & OpEx set cost trajectories
- Years 5-10
 - Note >10% effect after depreciation
 - X16 has 20% improvement

5G and millimeter-wave (mm-wave)

Fleet Size versus Site Density

Results & Discussion

- Double the site density equates to half the fleet size.
- OpEx impact is dramatic.
- Parallel Test Efficiency (PTE) matters; in fact, 1% PTE delta at x16 sites affects fleet size by 10%.
- Additional PTE versus Site Count on CoT insights available¹

TestConX

Parallel Test Efficiency (PTE) Refresher

Results & Discussion

- Ideally, 100% PTE equates to truly parallel operation.
- Practically, PTE degrades as some operations become serialized.
- Test engineers optimize their test plans for quality control and highest possible PTE, otherwise test duration degrades proportional to serial impacts.
- Tester complexity that we cannot afford to ignore.

ATE	Device Inte	erface Board	ATE
Tester Resource(s) #1	DUT 1	DUT 9	Tester Resource(s) #9
Tester Resource(s) #2	DUT 2	DUT 10	Tester Resource(s) #10
Tester Resource(s) #3	DUT 3	DUT 11	Tester Resource(s) #11
Tester Resource(s) #4	DUT 4	DUT 12	Tester Resource(s) #12
Tester Resource(s) #5	DUT 5	DUT 13	Tester Resource(s) #13
Tester Resource(s) #6	DUT 6	DUT 14	Tester Resource(s) #14
Tester Resource(s) #7	DUT 7	DUT 15	Tester Resource(s) #15
Tester Resource(s) #8	DUT 8	DUT 16	Tester Resource(s) #16

High Volume Manufacturing of 5G RF Transceivers

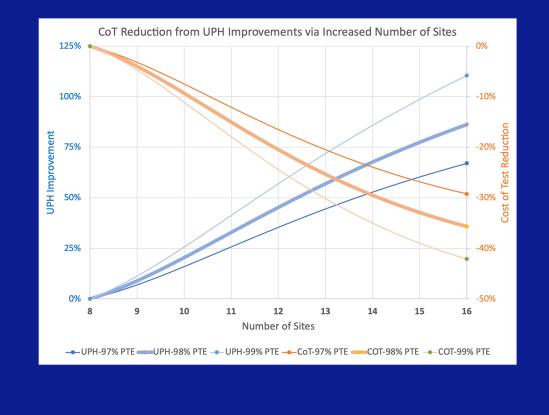

5G and millimeter-wave (mm-wave)

Fleet Size versus Site Density

Results & Discussion

- Double the site density equates to higher units per hour (UPH), depending on PTE.
- 1% PTE delta at x16 sites equates to 20% UPH improvement.
- At higher site density, CoT fluctuates depending on PTE.

High Volume Manufacturing of 5G RF Transceivers

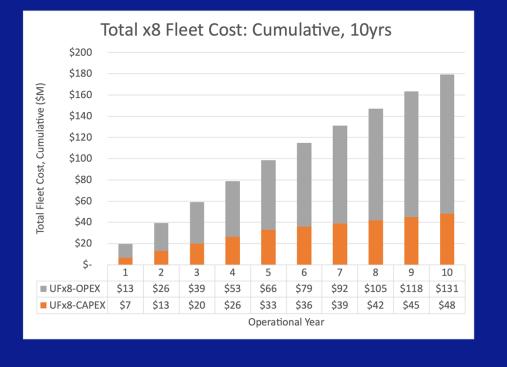

5G and millimeter-wave (mm-wave)

Breakdown Capex & OpEx: x8 Sites

Results & Discussion

TCO cumulative lifetime costs are dominated by OpEx (not CapEx).

High Volume Manufacturing of 5G RF Transceivers

TestConX Workshop

www.testconx.org

5G and millimeter-wave (mm-wave)

Breakdown Capex & OpEx: x16 Sites

Results & Discussion

TCO cumulative lifetime costs are now more evenly distributed (and lower overall).

High Volume Manufacturing of 5G RF Transceivers

TestConX Workshop

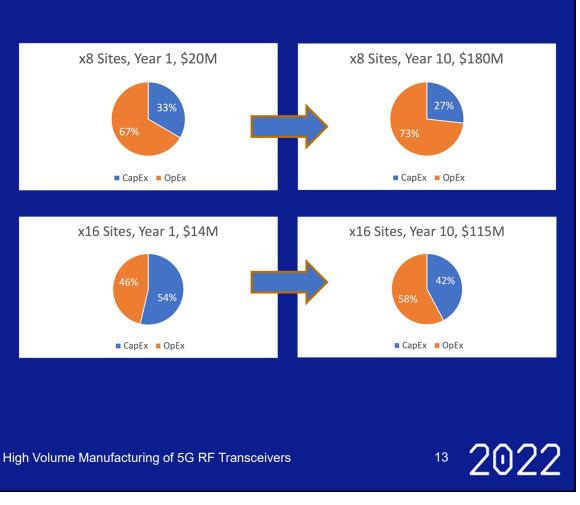

www.testconx.org

Lifetime Comparison: x8 versus x16 sites

Results & Discussion

- At x16, note redistribution of expenses towards CapEx.
- Higher CapEx that delivers greater UPH is desirable.
- Cuts the fleet size in half leads to dramatically lower OpEx and total CoT.

Test**ConX**®

5G and millimeter-wave (mm-wave)

Conclusion

- As these results demonstrate, parallelism and efficiency are powerful mechanisms fueling relentless cost reductions in the high volume manufacturing semiconductor ecosystem.
- The biggest financial decision is the selection of site density for new silicon.
- 5G complexity & economics will motivate greater site density.
- Double the site density cuts the fleet size in half and greatly reduces TCO.
- PTE optimizes CoT results, especially at higher site counts.

High Volume Manufacturing of 5G RF Transceivers

TestConX 2022

5G and millimeter-wave (mm-wave)

Recommendation

We should all continue to prioritize our total CoT activities in the following order:

- 1. Minimize OpEx with focus on UPH, including optimal PTE
- 2. Minimize test duration for optimal yield, including defect escapes
- 3. Minimize CapEx

High Volume Manufacturing of 5G RF Transceivers

5G and millimeter-wave (mm-wave)

Future Work

- Transceiver trends: convergence FR1-FR2 (5G-IF)
- Antenna to Bits, beamforming trends: Over The Air (OTA) methods (FR2-mmWave),
- DIB complexity topics: application space size, signal delivery, signal integrity, co-location, interference, site-to-site correlation
- RF to Bits, interface trends for RF, mmWave, OTA and for high speed serial
- Signal delivery technology, including data for blind mate interface versus insertion count
- Test methodology: RF calibration repeatability & stability
